

Analysis of Survival data

11.1 Data Collection in Follow-up Studies

11.2 The Life-Table Method

11.3 The Product-Limit Method

1

- Survival time/Time to event/Failure data
 - Subject ID
 - Entry date (event 1: Dx)
 - Latest date (event 2: dead)
 - Status at latest date
- Will have partial info for some subjects
 - Study stopped before event occurs for some subjects
 - Subjects lost to follow-up
 - Right censoring: subject known to have survived to certain time, but it is unknown when beyond that time died (or will die)
- Main assumption: censoring independent of event of interest (time at censoring has no information on potential time at failure)
- Raw survival data is a list of subjects with values for survival time, status and other covariates collected at the beginning of the study or over time
- Tabulated data would look like Table 11.1 (p. 299)

• DOI: 10.1007/978-3-540-26577-1_18

2

11.2 The Life-Table Method

- Cumulative Distribution Function $F(x) = P[X \leq x]$
Probability that a subject will not survive beyond time x

- Survival Function $S(x) = P[X > x] = 1 - F(x)$
Probability that a subject survives beyond time x

- Hazard Function $h(x) \approx P[\text{event occurs in } x + \delta]$
Probability of event occurring in a small unit of time just after x

- Hazard Ratio/Risk Ratio/Relative Risk $RR = \frac{h(x | \text{Group A})}{h(x | \text{Group B})}$
How much more/less likely are those in group A to experience the event by time x, compared to those in group B

3

Table 11.2

Years after Diagnosis	Midpoint	Death d_i	Lost l_i	Withdrawn w_i	Number Entering Interval n_i	Exposed to Risk n'_i	Conditional Probability		Cumulative Probability Surviving P_i	$\frac{q_j}{n'_j(1-q_j)}$	Standard Error $SE(P_i)$
							Dying q_i	Surviving $1-q_i$

16-17	16.5	0	0	9	9	4.5	0.0000	1.0000	0.1309	0.00000000	0.0119

$$q_i = \frac{d_i}{n_i - \frac{l_i + w_i}{2}} = \frac{d_i}{n'_i}$$

$$\widehat{\text{var}}(P_i) = P_i^2 \sum_{j=1}^{i-1} \frac{q_j}{n'_j(1-q_j)}$$

$$P_1 \equiv 1$$

$$P_2 = (1 - q_1)$$

$$P_3 = (1 - q_2)(1 - q_1) = (1 - q_2)P_2$$

4

- To use tabulated survival times in SPSS, you need to 'expand' the data:
e.g. for 8-9 interval create 7 observations with times in range [8,9) and status dead, and 35 observations with status censored (for SAS usage see website)
- **Editing a Table** (see slide #8)
 - Double click on Table to be modified
 - Pivot Table opens
- Change width of a column
 - Place cursor on right side of column to be modified
 - Cursor will change to ↔
 - Left click shows column width
 - Drag ↔ cursor to desired width
- Change number of decimals to display
 - Click on top cell, hold Shift key down, left click on bottom cell
 - Release Shift key, right click inside selected cells, select "Cell Properties"
 - Change "Decimals" tab

5

- Load data
- 'Analyze' → 'Survival' → 'Life Tables'
- Assign 'Time' variable; enter values in 'Display Time Intervals'
- Assign 'Status' variable; set values in 'Define events' tab
- Select from 'Options' tab: leave 'Life table(s)' checked (default); check "Survival" and 'Hazard'

The screenshot shows the SPSS Life Tables dialog boxes. The main 'Life Tables' dialog has 'Time' set to 'time', 'Display Time Intervals' from 0 through 17 by 1, and 'Status' set to 'censor(??)'. The 'Life Tables: Define Event for Status Variable' dialog shows 'Single value' set to 1. The 'Life Tables: Options' dialog shows 'Life table(s)', 'Survival', and 'Hazard' checked.

16.0	9	9	4.5	0	.00	1.00	.1309	.011915

a. The median survival time is .942

Approximate 95% percent CI for the 5-year survival probability

$$P_i \pm (z_{1-\alpha/2})s.e.(P_i) \rightarrow 0.224 \pm 1.96(0.008624) \rightarrow (0.207, 0.241)$$

If there were 2 groups can compare survival probabilities using at certain time

7

Editing a Table

The screenshot shows a spreadsheet window titled "Life Table". A context menu is open over a cell in the "Std. Error of Cumulative Proportion Surviving at End of Interval" column. The menu options include Cut, Copy, Paste, Clear, Select Table, Create Graph, Table Properties..., Cell Properties..., TableLooks..., Insert Footnote, Delete Footnotes, Hide Footnotes, Pivoting Trays, Toolbar, and Case Studies. The "Cell Properties" dialog box is open, showing the "Format" tab. The "Category" is set to "Number" and the "Format" is "#,##0.###". A "Sample" box shows the value ".009645". The "Decimals" are set to 6, and the "Adjust format for cell width" checkbox is checked.

8

Descriptives of the survival function are: mean and median

- Mean affected by skewed data (especially long survivors) and if last data are censored observation
 - See pages 302-304
- Median preferred
 - See pages 304-305

Hazard rate/function

$$h_i = \frac{d_i}{a_i(n'_i - d_i / 2)}$$

$$= \frac{2q_i}{a_i(2 - q_i)}$$

$$\widehat{\text{var}}(h_i) = h_i^2 \left(\frac{1 - (h_i a_i / 2)^2}{n'_i q_i} \right)$$

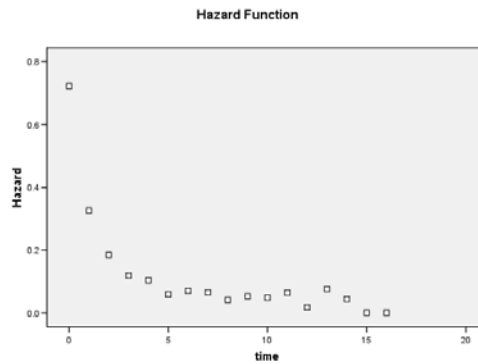

Cumulative Proportion Surviving at End of Interval	Std. Error of Cumulative Proportion Surviving at End of Interval	Probability Density	Std. Error of Probability Density	Hazard Rate	Std. Error of Hazard Rate
.4692	.009645	.5308	.009645	.7226	.017874

.1309	.011915	.0058	.005711	.0435	.043468
.1309	.011915	.0000	.000000	.0000	.000000
.1309	.011915	.0000	.000000	.0000	.000000

A 95% CI for the mortality rate in the first year is

$$h_i \pm (z_{1-\alpha/2})s.e.(h_i)$$

$$0.723 \pm 1.96(0.0179)$$

$$(0.688, 0.758)$$

11.3 The Product-Limit Method

- For small sample sizes
- Also known as the Kaplan-Meier method
- Goal: to estimate survival function without grouping data
- Principles for estimation are similar to Life-Table method

- See Example 11.2 (p. 306-307)
 - Table 11.4 is data from clinic records
 - Calculate survival times
 - Subject 1: Discharge January 1990; Termination December 1993;
Status Still sober (withdrawn) → time=47, status=0 (censored) → 47*
 - Procedure on page 307-309

- Using SPSS
 - Type-in all data (Times and corresponding status)
 - Analyze → Survival → Kaplan-Meier
 - Assign 'Time' variable
 - Assign 'Status' variable → Set status codes in 'Define Event' tab
 - Leave default checks ('Survival table' and 'Mean and median survival')
 - Check 'Survival' and 'Hazard' plots

11

The screenshot shows the SPSS interface for performing a Kaplan-Meier survival analysis. The main window displays a data table with the following data:

	Time	Censor
1	4	1
2	6	1
3	6	1
4	9	0
5	10	1
6	14	0
7	16	1
8	17	0
9	19	1
10	20	1
11	28	1
12	31	1
13	34	0
14	47	0

The 'Kaplan-Meier' dialog box is open, showing the 'Time' variable selected for the Time variable and 'Censor(1)' selected for the Status variable. The 'Kaplan-Meier: Options' sub-dialog is also open, showing the following options:

- Statistics:
 - Survival table(s)
 - Mean and median survival
 - Quartiles
- Plots:
 - Survival
 - One minus survival
 - Hazard
 - Log survival

12

Case Processing Summary

Total N	N of Events	Censored	
		N	Percent
14	9	5	35.7%

Survival Table

	Time	Status	Cumulative Proportion Surviving at the Time		N of Cumulative Events	N of Remaining Cases
			Estimate	Std. Error		
1	4	1	.9286	.068830	1	13
2	6	1	.	.	2	12
3	6	1	.7857	.109664	3	11
4	9	0	.	.	3	10
5	10	1	.7071	.123683	4	9
