On Distributed Active Learning

Dr. Huimin Chen

Associate Professor of Electrical Engineering

University of New Orleans

In this talk, I will introduce active learning as an important machine learning method for classification and multi-arm bandit problems. To effectively integrate multiple agents in a distributed active learning setting, I will discuss rejection sampling based method and some modifications adapted to classification and reinforcement learning problems. The approach has potential to attack large scale machine learning problems with distributed computing resources and reduced number of queries on the training data.
