

**Cancer Incidence in Louisiana by Census Tract
2007-2016**

Mission

To collect and report high-quality and timely population-based cancer data in Louisiana to support cancer research, control, and prevention.

Vision

To reduce suffering and death from cancer using information collected by the Louisiana Tumor Registry.

Editors

Acknowledgments

As with all reports produced by the Louisiana Tumor Registry (LTR), much appreciation goes to those whose dedication and hard work assist in the timely collection of high-quality data. The LTR sincerely thanks:

Louisiana Tumor Registry Regional Directors/Managers

Angela Crossgrow, CTR, Manager, Regions 1 & 3
Nicole Magee, CTR, Director, Regions 2 & 5
Lea Guidry, RHIA, CTR, Director, Region 4
Brigitte Shows, RT, CTR, Program Manager, Region 5
Nadine Johnston, RHIA, CTR, Director, Regions 6–8
Ramona Rachal, CTR, Coordinator, Region 6
Candace Crowe, CTR, Coordinator, Region 7
Melanie Byargeon, RHIA, CTR, Coordinator, Region 8

Hospital cancer registries in Louisiana Louisiana Cancer Registrars' Association

Physicians and staff members in:

Medical records offices, Pathology laboratories, Physician offices and clinics,
Free-standing treatment facilities, Hospice programs

Host Institutions:

The Louisiana Tumor Registry sincerely thanks the following healthcare institutions for their generosity in providing a home, along with internet and other support services, to the LTR regional offices for many years:

Regions 1 & 3: LSU Board of Supervisors and LSU Health Sciences Center-New Orleans (since 1995)
Region 2: Mary Bird Perkins Cancer Center (since 1983)
Region 4: Acadiana Medical Research Foundation (since 1983)
Region 5: Mary Bird Perkins Cancer Center (since 2013)
Regions 6, 7, & 8: University of Louisiana at Monroe (since 1988)

School of Public Health, LSU Health Sciences Center–New Orleans
Louisiana Cancer Prevention and Control Programs
Louisiana Cancer and Lung Trust Fund Board
Coroners' offices
Office of Public Health, Louisiana Department of Health

Funding Agencies:

- National Cancer Institute's Surveillance, Epidemiology and End Results Program
- Centers for Disease Control and Prevention's National Program of Cancer Registries
- State of Louisiana

How to Identify Your Census Tract

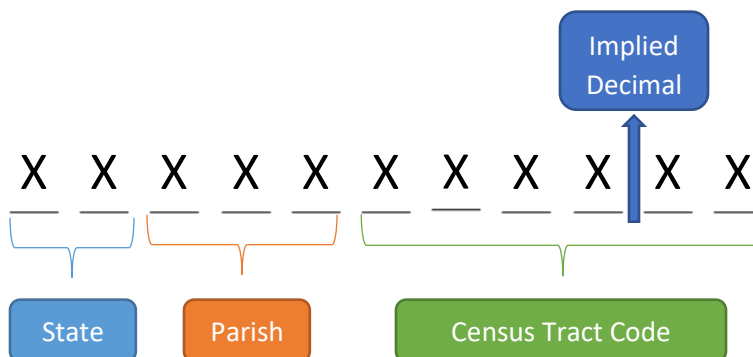

The U.S. Census Bureau states that:

“Census Tracts are small, relatively permanent statistical subdivisions of a county or equivalent entity that are updated by local participants prior to each decennial census as part of the Census Bureau's Participant Statistical Areas Program. [...] The primary purpose of census tracts is to provide a stable set of geographic units for the presentation of statistical data.”

In this report, an eleven-digit number identifies the census tract.

1. Digits 1 and 2 are the state code. For Louisiana, this is “22.”
2. Digits 3-5 are the parish code. For example, Acadia Parish is “001.”
3. Digits 6-11 are the census tract code, as described below:

“Census Tract Codes and Numbers—Census tracts are identified by an up to four-digit integer number and may have an optional two-digit suffix; for example 1457.02 or 23 [census tract numbers on the linked maps below]. The census tract codes consist of six digits with an implied decimal between the fourth and fifth digit corresponding to the basic census tract number but with leading zeroes and trailing zeroes for census tracts without a suffix. The tract number examples above would have codes of 145702 and 002300 [digits 6-11 of the census tract codes on the report tables], respectively.”

Introduction

The Louisiana Tumor Registry (LTR) is a statewide population-based cancer surveillance program that is mandated by law to gather data on cancers occurring in Louisiana residents from in-state and out-of-state medical/health records, as well as provide cancer statistics to aid in the assessment of cancer incidence, survival rates, and other aspects of the cancer burden in Louisiana. LTR data has been used to (1) guide statewide cancer control programs, (2) assess the magnitude of the cancer burden in Louisiana, (3) identify areas and populations at high risk of cancer, (4) monitor trends in cancer incidence over time, (5) advance clinical, epidemiologic and health services research, (6) assess the quality and effectiveness of care, (7) project future needs of healthcare facilities, and (8) help set priorities for allocating health resources. Since 1996, the LTR has published 34 annual *Cancer in Louisiana* monographs, which includes cancer incidence and mortality rates in Louisiana by race, sex, cancer type, and geographic area (region and parish). However, due to legislative restrictions, the LTR did not publish cancer incidence data below the parish level prior to March 2018.

In 2017, during the Louisiana Regular Session, legislators passed House Bill 483 (Act No. 373), authorizing the LTR to publish cancer incidence counts and rates for individual census tracts, unless such data would disclose the identity of any person to whom the data was related, thus violating the requirements of the Health Insurance Portability and Accountability Act (HIPAA), which governs the use and disclosure of protected health information (45 CFR 164.514). In such situations, the House Bill states that the LTR may combine more years of cancer data together at the census tract level or not show the data according to the rule of the United States Cancer Statistics (USCS) publications. As a result of this House Bill, LTR published the first *Cancer Incidence in Louisiana by Census Tract* report in March 2018. Since then, LTR has published this report annually using newly available data. This report is the third cancer incidence report at the census tract level published by the LTR.

To comply with legislative restrictions pertaining to HIPAA rules (<https://www.hhs.gov/sites/default/files/hipaa-simplification-201303.pdf>) for protecting cancer patient privacy and USCS standards (<https://www.cdc.gov/cancer/npcr/uscs/pdf/uscs-2014-technical-notes.pdf>) for generating reliable cancer incidence rates, as usual, we combined cancer data from multiple years to increase the number of census tracts meeting the publication criteria (population >20,000 and case count ≥ 16) so that their cancer incidence could be presented in this report. The methods section below explains this in more detail.

This report contains the cancer incidence data for diagnosis years 2007 through 2016 for all cancers combined, as well as for the specific cancer types (i.e., prostate, lung & bronchus, female breast, colon & rectum, kidney & renal pelvis, non-Hodgkin lymphoma, urinary bladder, melanoma of

the skin, pancreas, leukemia, oral cavity & pharynx, thyroid, corpus uterus, and liver & intrahepatic bile duct). Incidence rates and counts for other cancers are not provided because even after combining multiple years of data together, the case counts are too low and/or the population size is too small to meet the above-mentioned publication criteria.

This report includes five sections: Introduction, Methods, Results, Discussion, and Appendices. The introduction provides background information related to this report. The methods section provides information on the data sources, data verification process, and methods used for statistical analysis. The results section summarizes the major findings and focuses on census tracts with statistically significantly higher incidence rates than Louisiana. We also produced maps to illustrate the results. The discussion section includes interpretations of the findings, as well as the limitations of registry data. [Appendix A](#) includes tables with rates and counts for all census tracts meeting the publication criteria regardless of whether their cancer incidence rates are statistically significantly higher than Louisiana's rates.

Methods

Data Sources

Cancer incidence data

Cancer incidence data used for this report, diagnosis years 2007-2016, were collected by the LTR from all healthcare facilities, both in state and out-of-state, that diagnose and/or provide treatment and care to Louisiana cancer patients. Louisiana law (R.S. 40:1105.5) requires that all hospitals, pathology laboratories, radiation centers, physicians, nursing homes, hospices, other licensed health care facilities and providers, as well as coroners' offices, report cancer cases to the LTR. Cancer data collection begins by identifying people with cancer through screening pathology reports and/or disease indexes of hospitals, outpatient clinics, radiology departments, doctors' offices, pathology laboratories, surgical centers, or from other providers who diagnose and/or treat cancer patients. The LTR also links its data annually with the state's death certificate file and hospital in-patient discharge data to ensure the completeness of case ascertainment. The LTR has established interstate data exchange agreements with 43 state cancer registries and the registries of the District of Columbia, 3 United States (U.S.) territories, and Bermuda to obtain data on Louisiana cancer cases diagnosed or treated at out-of-state facilities.

The LTR only collects data on reportable cancers. Reportable cancers are determined by the standard-setting organizations in the U.S., including the National Cancer Institute's Surveillance, Epidemiology, and End Results (SEER) Program, the Centers for Disease Control and Prevention's National Program of Cancer Registries (NPCR), and the American College of Surgeon's Commission on Cancer (See the NAACCR Data Standards & Data Dictionary, Chapter III: <http://datadictionary.naaccr.org/>).

The cancer types included in this report are defined based on the International Classification of Diseases for Oncology, Third Edition (ICD-O-3) (<http://codes.iarc.fr/>) and the SEER recode ICD-O-3 (https://seer.cancer.gov/siterecode/icdo3_dwhohome/index.html). Only invasive (malignant) cancer cases as defined by SEER's behavior recode for analysis (<https://seer.cancer.gov/behaviorrecode/>) are included. These are cancers that have spread beyond the layer of tissue in which it developed and is growing into the surrounding, healthy tissues.

Cases diagnosed after 2016 are not included because the most recent, complete cancer incidence data in Louisiana is from diagnosis year 2016, which is consistent with other state cancer registries in the U.S.

Population data

The population data were from Woods & Poole Economics, Inc. Although the 2010 U.S. Census data is the most accurate population data and was used for our previous reports of cancer incidence at the census tract level, it is the population data for a single year (2010). Given that the year 2010 does not fall in the middle of the diagnosis years included in this report (2007-2016), it became evident that we would need to use a population estimate that could better represent the increasing population for the years after 2010. Woods & Poole estimates the population of each census tract for each individual year. Thus, using Woods & Poole population data to calculate the cancer incidence rates of more recent years would be more appropriate than using the 2010 Census data as the population estimate for each year from 2007-2016. To assess whether the use of Woods & Poole population data would cause unexpected changes in cancer incidence rates, LTR statisticians compared the population counts and cancer incidence rates for 10 selected census tracts for rolling 5-year periods from 2007 to 2014 using Woods & Poole population data versus using 2010 Census data. No major differences in incidence rate or rate ratio were observed between the two population data sources. After consulting with experts from the National Cancer Institute and conducting this preliminary analysis, the Woods & Poole population data were determined to be appropriate population estimates that would produce reliable cancer incidence rates at the census tract level.

Woods & Poole population estimates for intercensal years (2001-2009) are based on linear interpolations between the 2000 Census and 2010 Census. Postcensal population estimates (2011-2020) are based on the 2010 Census and assume that the proportion of the population by age and gender for each tract in a particular county in 2010 would remain constant. A more detailed explanation of the population estimates can be found in [Appendix B](#).

Data Verification Process

Residential addresses

To produce accurate cancer incidence rates and counts at the census tract level, the first step is to geocode addresses of patients diagnosed with reportable cancers between 2007 and 2016, using

the standard geocoding tool (<http://geoservices.tamu.edu/Services/Geocode/>) built into the LTR database. Geocoding addresses produces geographic coordinates that enable the assignment of cases to particular census tracts. Medical records are the primary source for obtaining a patient's address at the time of his/her cancer diagnosis. If a patient address in the medical record is incorrect, geocoding is not possible. In addition, if a medical record only has a Post Office (PO) Box address, the cancer case could be assigned to an incorrect census tract, because a residential address and a PO Box for one patient may fall into two different census tracts. Due to small cancer counts, any misclassification could result in either an over or underestimate of cancer incidence in some census tracts. To minimize these potential issues, the LTR devoted many resources to the identification of residential addresses at the time of cancer diagnosis for cancer cases by either verifying with healthcare facilities or manually searching online public records sources, state death records, and other databases. Because of the diligent work of the LTR staff, less than 2.5% of cancer cases diagnosed from 2007-2016 have no residential address in the LTR database for this report; these cases were included in the calculation of cancer incidence rates for Louisiana, but excluded from the calculation of incidence for individual census tracts.

Geocoding cancer cases from prisons and military bases

In accordance with SEER Program coding rules (<https://seer.cancer.gov/tools/codingmanuals/>), the address at the time of cancer diagnosis for a prisoner is the physical address of the prison. Because prisoners diagnosed with cancers were included in both the 2010 Census, as well as the LTR cancer incidence counts in the census tracts where these facilities are located, geocoding based on the prison address is appropriate. Caution may be necessary when interpreting these incidence rates due to the vulnerable and cluster natures of prisoners.

Cancer cases from military bases are geocoded to the address of the installation according to the standard SEER Program coding rules (https://seer.cancer.gov/manuals/2018/SPCSM_2018_main-doc.pdf; Section III, pg. 33-34). However, the U.S. Census Bureau uses multi-step rules for determining the addresses of military personnel and their families. The address assignment takes into account various factors summarized in the following links:

https://www.census.gov/population/www/cen2010/resid_rules/resid_rules.html#TWELVE

https://www.census.gov/topics/population/veterans/about/faq.html#par_textimage_9

The differences in geocoding rules between SEER and the U.S. Census may result in over or underestimating cancer incidence in census tracts with military installations ([Appendix C](#)).

Statistical Analyses

Standard protocols were used in computing cancer incidence counts and rates; only reportable invasive cancer cases were included in the count and rate calculations (with the exception of bladder cancer for which both in situ and invasive cases were included). All data analyses were conducted using SEER*Stat software (<https://seer.cancer.gov/seerstat/>) and the following database:

*SEER*Stat Database: SEER*DMS - LTR, 2007-2016, 1/22/2020 extract Woods and Poole pops by tract. Created on 1/22/2020. Population Data Source: Woods & Poole Economics, Inc. Washington, D.C. Copyright 2018. Woods & Poole does not guarantee the accuracy of this data. The use of this data and the conclusion drawn from it are solely the responsibility of [Licensee].*

Incidence rates

Cancer incidence rate is the number of newly diagnosed cancer cases in a specified population during the specified years, usually expressed as the number of cancers per 100,000 persons.

$$\text{Incidence Rate} = \frac{\text{number of new cancers diagnosed in the specified year(s)}}{\text{Population count in the specified year(s)}} \times 100,000$$

In this report, the numerator is the number of invasive cancers newly diagnosed from 2007 to 2016. The denominator is the sum of the population estimates for each year from Woods & Poole Economics, which are extrapolated from the 2000 Census and 2010 Census, for the years 2007-2016.

Cancer incidence rates in this report were presented as age-adjusted rates, which is a standard way to report cancer rates. The age adjustment allows for meaningful comparisons of cancer incidence rates across different census tracts by controlling for differences in age distributions of the populations. This control is important because cancer is diagnosed more frequently among the elderly. Age-adjusted rates are the weighted average of the age-specific rates, where the weights represent the age distribution of a standard population. The 2000 U.S. Standard Population was used in this report, which is consistent with current publications of cancer incidence rates in the U.S. The 95% confidence interval (CI) of the rate is the range around a point estimate of the rate within which the true value is likely to lie with 95% probability; the wider the 95% CI, the less precise the rate estimate.

Rate ratios

To compare the cancer incidence rate of individual census tracts with the rate for Louisiana, rate ratios are provided in the tables. For more information on the calculation of rate ratios, please visit: https://seer.cancer.gov/seerstat/WebHelp/Rate_Algorithms.htm.

$$\text{Rate Ratio} = \frac{\text{Age - adjusted incidence rate for a specific census tract}}{\text{Age - adjusted incidence rate for Louisiana}}$$

If a rate ratio is equal to 1.0, the cancer incidence rate for a specified census tract is the same as the cancer incidence rate for Louisiana. If the rate ratio is greater than 1.0, the rate for the census tract is higher than the rate for Louisiana. If the rate ratio is less than 1.0, the rate of the census

tract is lower than the rate for Louisiana. We provide the individual 95% confidence interval for each rate ratio; the wider the 95% CI, the less precise the rate ratio. If the 95% CI includes 1.0 for a rate ratio, the difference between the incidence rate for the census tract and Louisiana is not statistically significant. A p-value is also provided in the tables to show whether the rate ratio is statistically significantly different from Louisiana. Typically, a p-value that is less than 0.05 indicates that the cancer incidence rate for the census tract is statistically significantly different from the state rate. Each rate comparison between the census tract and Louisiana was done individually. Because of the interests of the public, the description of findings focuses on census tracts with statistically significantly higher incidence rates when compared with Louisiana.

Results

Cancer Incidence Counts and Rates by Census Tract

Out of 1,148 census tracts in Louisiana, 920 census tracts meet the publication criteria for all cancers combined (Table 1). For specific cancer types, fewer census tracts meet the criteria. For the Louisiana census tracts meeting the criteria, their incidence rates for all cancers combined and for specific cancer types were compared with the corresponding rates for the entire state. For example, for all cancers combined, 69 census tracts had higher incidence rates and 91 census tracts had lower incidence rates than the corresponding rates for Louisiana by individual statistical tests at the significance level of 0.05. The numbers of census tracts with statistically significantly higher incidence rates as compared to the rates for Louisiana varied by specific cancer type. Overall, 267 census tracts had statistically significantly higher incidence rates for all cancers combined and/or for one or more specific cancer types.

All Cancers Combined

Of the 920 census tracts meeting the publication criteria when 2007-2016 data were combined, 69 census tracts from 27 parishes had statistically significantly higher incidence rates for all cancers combined as compared with Louisiana; rate ratios varied from 1.11 to 2.67 (Table 2 and Figure 1).

Prostate

Of the 457 census tracts meeting the publication criteria, 32 census tracts in 16 parishes had statistically significantly higher prostate cancer incidence rates than Louisiana; rate ratios varied from 1.27 to 1.97 (Table 3 and Figure 2).

Lung & Bronchus

Of the 845 census tracts meeting the publication criteria, 62 census tracts in 28 parishes had statistically significantly higher lung and bronchus cancer incidence rates than Louisiana; rate ratios varied from 1.34 to 2.06 (Table 4 and Figure 3).

Female Breast

Of the 510 census tracts meeting the publication criteria, 17 census tracts in 8 parishes had statistically significantly higher female breast cancer incidence rates than Louisiana; rate ratios varied from 1.32 to 1.59 (Table 5 and Figure 4).

Colon & Rectum

Of 702 census tracts meeting the publication criteria, 48 census tracts in 31 parishes had statistically significantly higher colorectal cancer incidence rates than Louisiana; rate ratios varied from 1.40 to 2.08 (Table 6 and Figure 5).

Kidney & Renal Pelvis

Of 165 census tracts meeting the publication criteria, 17 census tracts in 13 parishes had statistically significantly higher kidney and renal pelvis incidence rates than Louisiana; rate ratios varied from 1.52 to 2.69 (Table 7 and Figure 6).

Non-Hodgkin Lymphoma

Of 121 census tracts meeting the publication criteria, 11 census tracts in 7 parishes had statistically significantly higher non-Hodgkin lymphoma incidence rates than Louisiana; rate ratios varied from 1.60 to 2.18 (Table 8 and Figure 7).

Urinary Bladder (including in situ)

Of 113 census tracts meeting the publication criteria, 21 census tracts in 14 parishes had statistically significantly higher urinary bladder incidence rates than Louisiana; rate ratios varied from 1.53 to 3.48 (Table 9 and Figure 8).

Melanoma of the Skin

Of 112 census tracts meeting the publication criteria, 59 census tracts in 18 parishes had statistically significantly higher melanoma of the skin incidence rates than Louisiana; rate ratios varied from 1.69 to 4.40 (Table 10 and Figure 9).

Pancreas

Of 16 census tracts meeting the publication criteria, 6 census tracts in 5 parishes had statistically significantly higher pancreatic cancer incidence rates than Louisiana; rate ratios varied from 1.67 to 2.41 (Table 11 and Figure 10).

Leukemia

Of 28 census tracts meeting the publication criteria, 6 census tracts in 6 parishes had statistically significantly higher leukemia incidence rates than Louisiana; rate ratios varied from 1.81 to 2.20 (Table 12 and Figure 11).

Oral Cavity & Pharynx

Of 23 census tracts meeting the publication criteria, 8 census tracts in 7 parishes had statistically significantly higher oral cavity and pharynx cancer incidence rates than Louisiana; rate ratios varied from 1.79 to 2.53 (Table 13 and Figure 12).

Thyroid

Of 26 census tracts meeting the publication criteria, 9 census tracts in 7 parishes had statistically significantly higher thyroid cancer incidence rates than Louisiana; rate ratios varied from 1.74 to 2.85 (Table 14 and Figure 13).

Corpus Uterus

Of 3 census tracts meeting the publication criteria, 1 census tract in 1 parish had a statistically significantly higher corpus uterus cancer incidence rate than Louisiana; the rate ratio was 2.18 (Table 15 and Figure 14).

Liver & Intrahepatic Bile Duct

Of 5 census tracts meeting the publication criteria, 5 census tracts in 5 parishes had statistically significantly higher liver and intrahepatic bile duct cancer incidence rates than Louisiana; the rate ratios varied from 1.98 to 2.64 (Table 16 and Figure 15).

Tables & Figures

Table 1. Number and percentage of census tracts meeting the publication criteria with statistically significantly higher or lower rates than Louisiana based on cancer cases diagnosed between 2007 and 2016.

	Average Annual Case Count in Louisiana	Census Tracts Meeting the Criteria ¹		Higher Rates		Lower Rates

Figure 3. Comparison of Cancer Incidence Rates¹ of Individual Census Tracts with Louisiana, Lung & Bronchus, 2007-2016

- The rate is statistically significantly lower than Louisiana.
- The rate is not statistically significantly different from Louisiana.
- The rate is statistically significantly higher than Louisiana.
- The census tract does not meet the requirements (population count > 20,000 and case count ≥ 16 for the 2007-2016 combined data) for publication of cancer incidence data, which is a restriction in state law that is in compliance with HIPAA rules and the standard of United States Cancer Statistics.

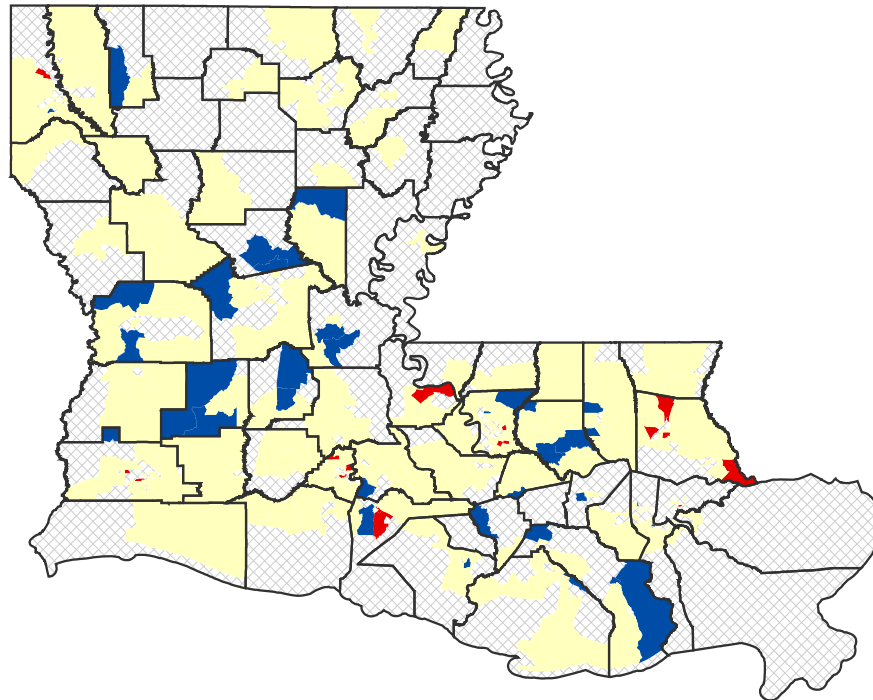

Risk Factors²

- Age
- Cigarette smoking (increases with amount and years of smoking)
- Cigar and pipe smoking
- Exposure to secondhand smoke
- Taking beta carotene supplements
- Exposure to radon gas, asbestos, certain metals (chromium, cadmium, arsenic), silica, beryllium, nickel chromate, some organic chemicals, radiation, vinyl chloride, mustard gas, coal products, or diesel exhaust
- Air pollution
- Occupational exposures, including: rubber manufacturing, paving, roofing, painting, chimney sweeping
- Personal or family history of lung cancer

¹Average annual age-adjusted (2000 US) incidence rates

²American Cancer Society, www.cancer.org/cancer.html; National Cancer Institute, www.cancer.gov.

Figure 4. Comparison of Cancer Incidence Rates¹ of Individual Census Tracts with Louisiana, Female Breast, 2007-2016

- The rate is statistically significantly lower than Louisiana.
- The rate is not statistically significantly different from Louisiana.
- The rate is statistically significantly higher than Louisiana.
- The census tract does not meet the requirements (population count > 20,000 and case count ≥ 16 for the 2007-2016 combined data) for publication of cancer incidence data, which is a restriction in state law that is in compliance with HIPAA rules and the standard of United States Cancer Statistics.

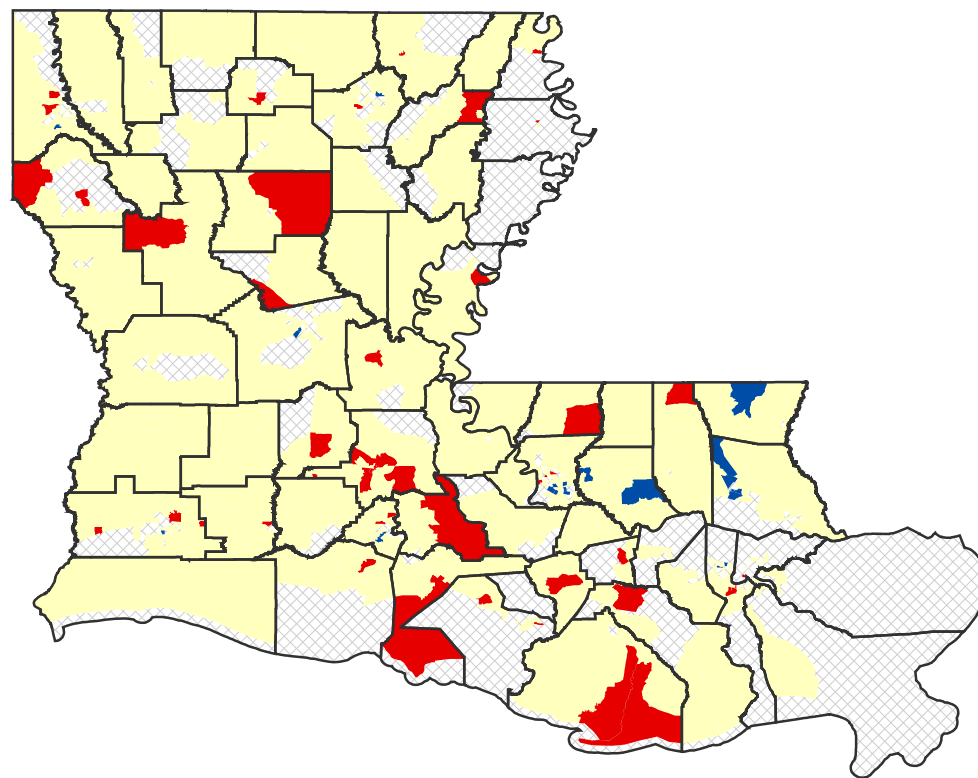

Risk Factors²

- Increased age
- Race/ethnicity
- Weight gain after age of 18
- Being overweight or obese
- Physical inactivity
- Alcohol consumption
- Long menstrual history (starting early and ending later in life)
- Never having children
- Having first child after age of 30
- Not breastfeeding
- Personal or family history of breast or ovarian cancer
- Inherited mutations in BRCA1, BRCA2, or other susceptibility genes
- Benign breast conditions (ex. atypical hyperplasia)
- Personal history of ductal or lobular carcinoma in situ, high-dose radiation to chest at young age, or high breast density
- Birth control
- Postmenopausal hormone use
- Long-term use of combination hormone replacement therapy
- Exposure to diethylstilbestrol

¹Average annual age-adjusted (2000 US) incidence rates

²American Cancer Society, www.cancer.org/cancer.html; National Cancer Institute, www.cancer.gov.

 The rate is statistically significantly lower than Louisiana.

 The rate is not statistically significantly different from Louisiana.

 The rate is statistically significantly higher than Louisiana.

 The census tract does not meet the requirements (population count > 20,000 and case count ≥ 16 for the 2007-2016 combined data) for publication of cancer incidence data, which is a restriction in state law that is in compliance with HIPAA rules and the standard of United States Cancer Statistics.

¹Average annual age-adjusted (2000 US) incidence rates

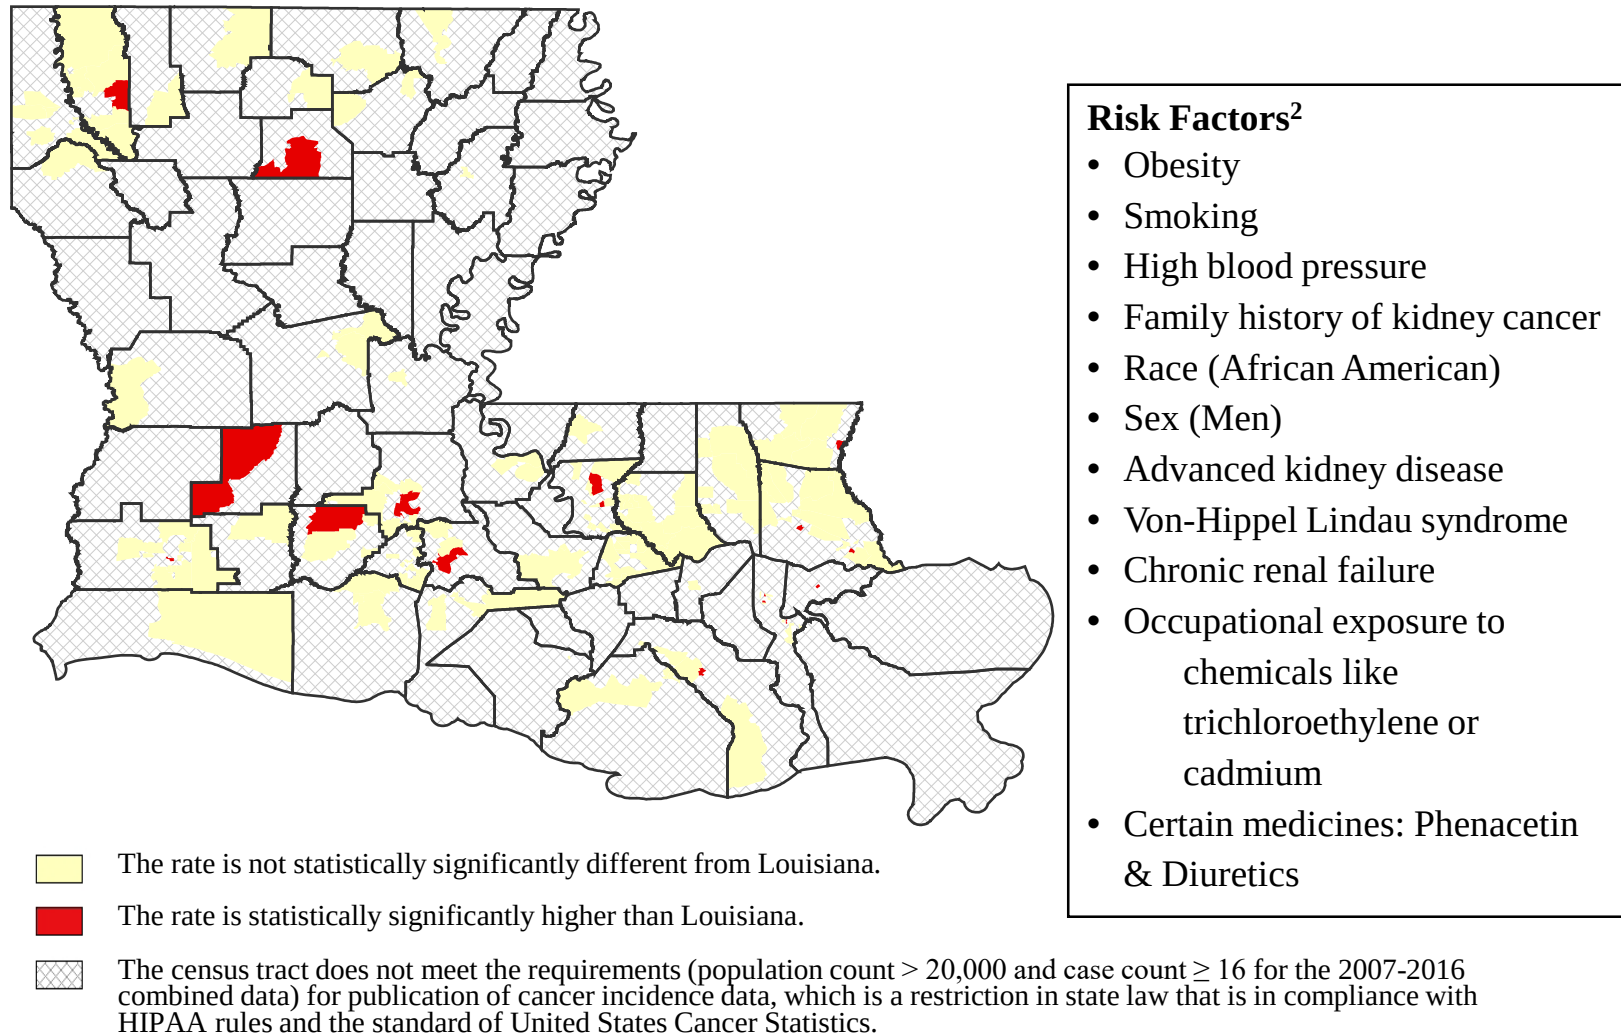

²American Cancer Society, www.cancer.org/cancer.html; National Cancer Institute, www.cancer.gov.

Risk Factors²

- Age
 - Race/ethnicity
 - Obesity
 - Physical inactivity
 - Long-term smoking
 - High consumption of red or processed meat
 - Low intake of calcium, fruits, vegetables, and whole-grain fiber
 - Moderate to heavy alcohol consumption
 - Personal or family history of colon or rectal cancer and/or polyps
 - Personal history of
- chronic inflammatory bowel disease, ulcerative colitis, or Crohn's disease
 - Inherited genetic conditions (ex. Lynch syndrome or familial adenomatous polyposis)
 - Type II diabetes
 - Long-term use of nonsteroidal anti-inflammatory drugs can reduce risk

Louisiana Tumor Registry

Figure 8. Comparison of Cancer Incidence Rates¹ of Individual Census Tracts with Louisiana, Urinary Bladder, Diagnosed in 2007-2016

- The rate is not statistically significantly different from Louisiana.
- The rate is statistically significantly higher than Louisiana.
- The census tract does not meet the requirements (population count > 20,000 and case count ≥ 16 for the 2007-2016 combined data) for publication of cancer incidence data, which is a restriction in state law that is in compliance with HIPAA rules and the standard of United States Cancer Statistics.

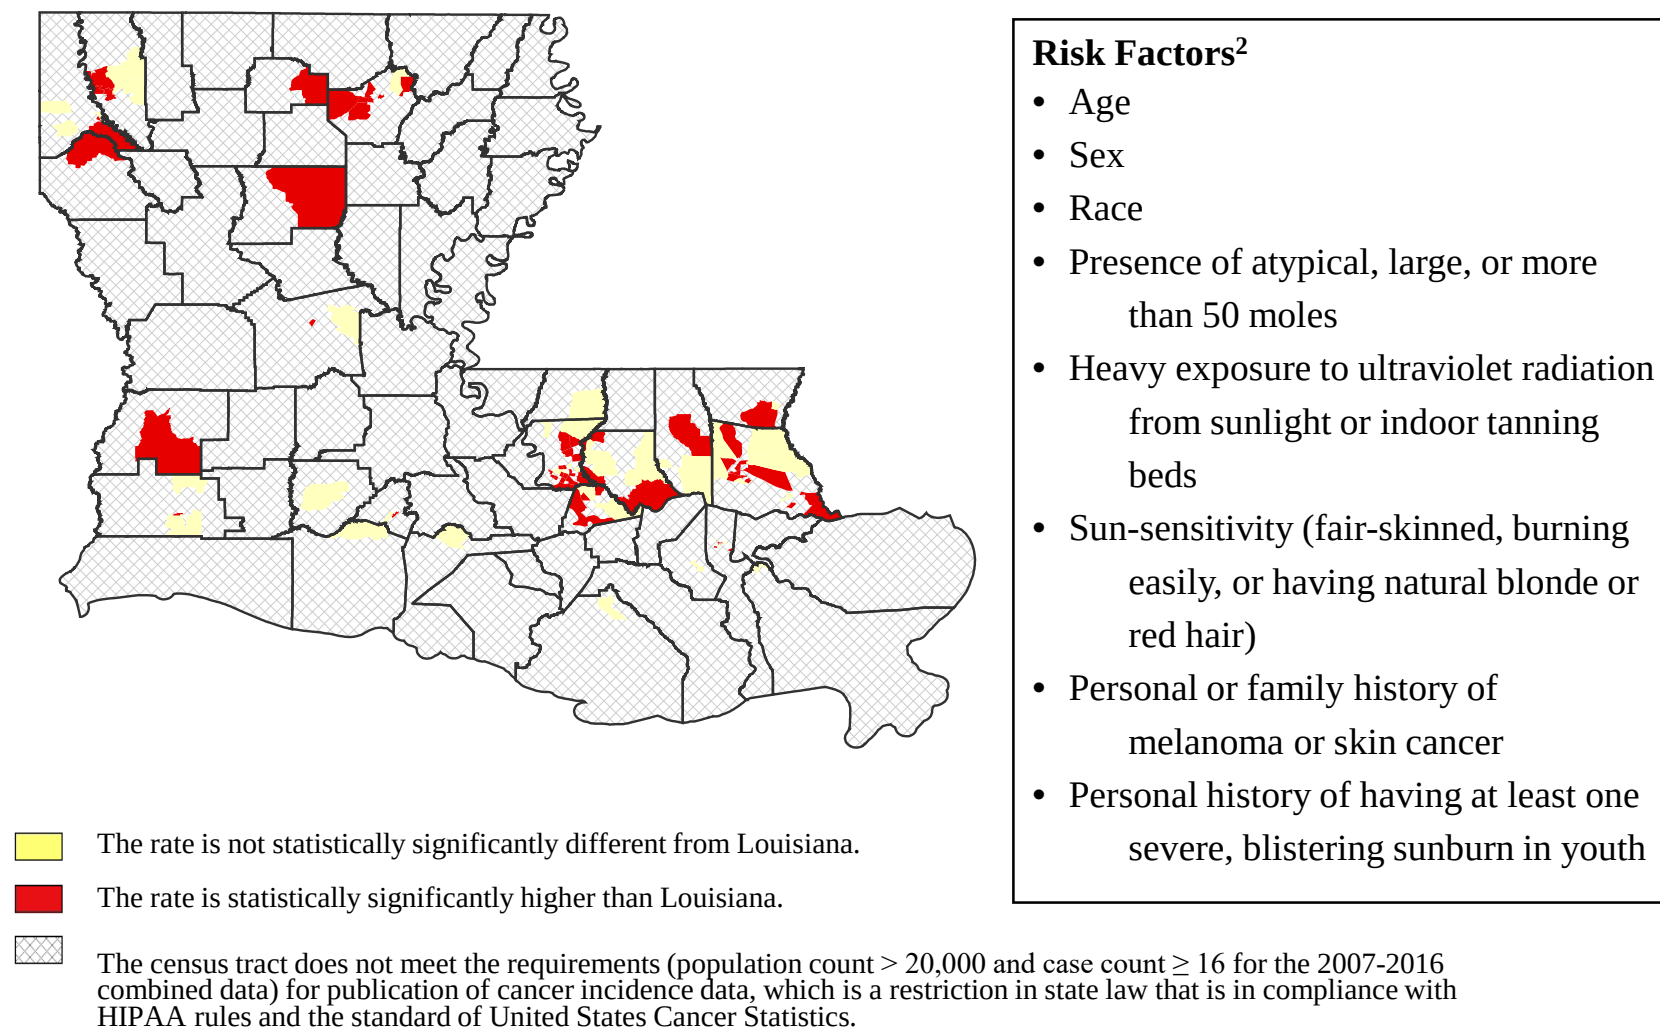

Risk Factors²

- Tobacco use
- Working in the dye, rubber, chemical, metal, textile, leather, or aluminum industries
- Working as a hairdresser, mechanist, printer, painter, or truck driver
- Living in a community with high levels of arsenic in the drinking water
- Bladder birth defects or long-term urinary catheters
- Cancer treatment with cyclophosphamide or having radiation therapy to abdomen or pelvis
- Personal or family history of bladder cancer
- Inherited genes (GST and NAT)
- Inherited genetic syndromes (retinoblastoma, Cowden Disease, Lynch Syndrome)

Discussion

For the 2007-2016 combined cancer incidence data, LTR identified that 23% of the census tracts in Louisiana had statistically significantly higher incidence rates for all cancers combined and/or for one or more specific cancer types. When an area is identified as having a higher cancer incidence rate, usually an indication of higher cancer risk, the next question normally is “why?” We need to take into account various components in order to begin answering this question. First, we need an understanding that cancer is a generic term used to describe a group of related diseases and that elevated incidence is most often attributable to multiple factors. The causes of cancer vary greatly by cancer type ([Appendix D](#)). Some factors are non-modifiable, meaning we cannot change them, such as age, race, and certain cancer-related genes. Others are modifiable factors, meaning we can take measures to change or avoid them. The American Association for Cancer Research (AACR) reports that the top modifiable risk factors are tobacco smoking, excess body weight, alcohol, ultraviolet radiation, poor diet, infections, and physical inactivity ([Appendix E](#)). Avoiding these modifiable risk factors will help reduce cancer risk and is often referred to as primary prevention.

Because some cancer risk factors are not modifiable, some people will develop cancer regardless. The strategy for secondary prevention is adhering to cancer screening guidelines to identify non-cancer growths, such as precancerous lesions that may increase the risk of cancer, and to detect cancer in its early stages. For example, most colorectal cancers begin as a polyp on the inner lining of the colon or rectum. Some types of polyps can develop into cancer over several years. If people comply with cancer screening guidelines to detect and remove polyps, colorectal cancer can be prevented. Another example is the Pap smear, which can detect abnormal cells on the cervix that may develop into cervical cancer if left untreated.

The LTR is the entity that counts and publishes cancer data in the state. To determine what caused a higher incidence rate in an area, scientists will need to conduct an investigation or a research study to quantify the contribution of individual risk factors. Such investigations or studies require collection of detailed data from individual residents in the area on their exposures to all known risk factors. These factors include lifestyle, diet, family history of cancer, environmental exposure, and much more. Because cancer development takes years, the data on risk factor exposure must be longitudinal. Therefore, such a retrospective investigation is very costly. Once the LTR report indicates higher cancer incidence rates in an area, the Louisiana Office of Public Health (OPH) is responsible for conducting a preliminary evaluation of any areas of concern and any needed feasibility studies, as well as making a determination about whether there is a need to perform an etiological investigation.

The cancer incidence rate indicates the average cancer risk of the residents in an area. While LTR data may show that cancer incidence rates in a census tract are not statistically higher than Louisiana, there may be individuals in that census tract that are at an increased risk of cancer. Additionally, even after combining 10 years of data together, the population and cancer incidence counts are still relatively small. Thus, the power to identify statistically significantly higher incidence rates as compared with Louisiana is limited. In other words, the ability of the statistical test to determine whether a rate is significantly higher is dependent upon the size of the population and cancer incidence counts. When these numbers are small, it is difficult to prove that the increased cancer incidence rate was not due to chance.

Several limitations of the registry data used for this report need to be disclosed.

- 1) Because we utilized population estimates and did not have an official count of every resident for each year included in the report, the population may be over or underestimated for some census tracts.
- 2) Less than 2.5% of cancer cases were excluded from the calculation of cancer incidence rates at the census tract level due to addresses that cannot be geocoded, which may result in the underestimation of cancer incidence for some census tracts.
- 3) The LTR relies on other state cancer registries to provide cancer data on Louisiana residents who were diagnosed or treated at out-of-state facilities. There is no way to ascertain the completeness of reporting from facilities outside of Louisiana.
- 4) Complete ascertainment of all reportable cancer cases is the priority of the LTR. While healthcare facilities and providers are obligated by law to report all cancer cases that they diagnose and/or treat, LTR staff are also actively involved in case-finding activities, especially for hospitals without a cancer registry and non-hospital settings. Using electronic pathology reporting, which covers over 95% of cancer cases, and other quality assurance activities, the LTR is able to capture the majority of missed cases and achieve the 98% completeness benchmark set by the SEER Program. However, because of small case counts in the individual census tracts, missing just a few cases may bias the statistical results.
- 5) Reliable cancer incidence rates and counts stratified by race and gender at the census tract level are not produced because of small case counts. Cancer incidence rates vary by population characteristics such as race and sex. For example, men usually have a higher rate than women, and rates of some types of cancer are much higher in certain race groups. Therefore, differences in cancer incidence rates for all races and both genders combined between individual census tracts and the state may be partially attributable to the variations in population characteristics.

Due to the above-mentioned limitations, few state cancer registries in the U.S. publish cancer incidence rates at the census tract level. We encourage users to be cautious in use and further interpretation of data included in this report and strongly suggest that they consult with epidemiologists and biostatisticians to avoid misinterpretation. For example, rate comparisons between each census tract and Louisiana were conducted individually. However, if conducting multiple comparisons

simultaneously, the overall type I error rate needs to be controlled. The priority of the LTR is to collect and provide high-quality and complete data to guide cancer control programs in their efforts to reduce the cancer burden in Louisiana. To achieve this goal, healthcare facilities and providers are encouraged to continue to report all cancer cases to the LTR as every case is of utmost importance to produce accurate data at the census tract level.

Appendix B. Intercensal and Postcensal Estimates of Residential Population by Census Tract – Technical Documentation

Introduction

Postcensal estimates of residential population by age (0, 1-4, 5-9, 10-14, 15-19, 20-24, 25-29, 30-34, 35-39, 40-44, 45-49, 50-54, 55-59, 60-64, 65-69, 70-74, 74-79, 80-84, and 85 and over) and gender were made for all U.S. Census tracts for the years 2011 to 2020.

Intercensal estimates of residential population by age and gender were made for all U.S. Census tracts for the years 2001 to 2009. The remainder of this technical documentation describes the methods used to create the postcensal and intercensal estimates.

Postcensal Estimates

The residential population estimates for all U.S. Census tracts for the years 2011 to 2020 were made by assuming that the proportion of population by age and gender for each tract in a particular county in 2010 would remain constant for the postcensal period. The proportion of population for each 2010 Census tract was multiplied by total county population by age and gender to yield postcensal tract estimates. The county total population by age and gender control estimates for the years 2011 to 2016 were from the NCI SEER Population Estimates database. The county total population by age and gender control population projections for the years 2017 to 2020 were from the 2018 Woods & Poole Economics, Inc. Regional Database. A description of Woods & Poole's historical and projected population data for U.S. counties can be found in the "Technical Description of the Woods & Poole Economics, Inc. 2018 Regional Projections and Database."

Intercensal Estimates, 2001 to 2009

The residential population estimates for all U.S. Census tracts for the years 2001 to 2009 were made by assuming that the proportion of population by age and gender for each tract in a particular county would change linearly from the 2000 and 2010 Census proportions. If a tract had 10% of the county male population age 20-24 in 2000 and 12% in 2010 then for each year 2001 to 2009 the proportion would be a linear interpolation of the 2000 and 2010 proportions. The county total population by age and gender control estimates for the years 2001 to 2009 were from the NCI SEER Population Estimates database.

Since Census tracts definitions changed from 2000 to 2010 two sets of estimates were prepared. One set provided intercensal estimates based on 2000 Census tract definitions and the other based on 2010 Census tract definitions. In order to estimate the proportion of population in each tract for a particular county in 2010, using 2000 Census tract definitions, it was necessary to estimate 2010 Census tract population based on 2000 Census tract definitions. Similarly, in order to estimate the proportion of population in each tract for a particular county in 2000, using 2010 Census tract definitions, it was necessary to estimate 2000 Census tract population based on 2010 Census tract definitions. These estimates were obtained by using the Census Bureau 2000-2010 Census Tract Relationship File which provided the total population in each Census tract and indicated which tract in 2010 related to a 2000 tract, and vice versa. For example, if a tract in 2000 was split into three tracts in 2010 because of population growth from 2000 to 2010 then the Relationship

File would provide the 2010 total population for each of the three tracts; to estimate 2000 population for these three tracts the 2000 population by age and gender for the original tract was split proportionally according to the 2010 population; to estimate 2010 population for the original 2000 tract the three new tracts were simply added together to create the 2000 tract.

Two sets of estimates were prepared on both the 2000 and 2010 based Census tracts to reflect county and parish adjustments for hurricanes Katrina and Rita.

Appendix D. Risk Factors by Cancer Type

Top Cancer Types in Louisiana	Non-Modifiable Risk Factors	Modifiable Risk Factors
Prostate	- Increased age (rises rapidly after age 50) - Race/Ethnicity: African ancestry - Family history of prostate cancer in first-degree relative - Certain inherited genetic conditions, including Lynch syndrome and BRCA1 and BRCA2 mutations - Prostate changes - Geography: more common in North America, north-western Europe, Australia, and on Caribbean islands	- Smoking - Taking vitamin E alone or folic acid - Diets high in dairy and calcium - Excess body weight - Chemical exposures - Inflammation of the prostate - Sexually transmitted infections - Vasectomy
Lung & Bronchus	- Age - Personal or family history of lung cancer - Multiple endocrine neoplasia type 1 (MEN1), an inherited syndrome - Radiation therapy to the chest for other cancers - HIV infection - Air pollution	- Cigarette smoking (increases with amount and years of smoking) - Cigar and pipe smoking - Exposure to secondhand smoke - Taking beta carotene supplements - Occupational exposures, including: rubber manufacturing, paving, roofing, painting, chimney sweeping - Exposure to radon gas, asbestos, certain metals (chromium, cadmium, arsenic), silica, beryllium, nickel chromate, some organic chemicals, radiation, vinyl chloride, mustard gas, coal products, or diesel exhaust - Arsenic in drinking water
Female Breast	- Height (tall / Being taller) - Increased age - Race/ethnicity - Long menstrual history (starting early and ending later in life) - Inherited mutations in BRCA1, BRCA2, or other susceptibility genes - Personal or family history of breast or ovarian cancer - Benign breast conditions (ex. atypical hyperplasia) - Personal history of ductal or lobular carcinoma in situ, high-dose radiation to chest at young age (especially	- Weight gain after age of 18 - Being overweight or obese - Physical inactivity - Alcohol consumption - Birth Control - Long-term use of combination hormone replacement therapy - Postmenopausal hormone use - Never having children - Having first child after age of 30 - Not breastfeeding

Top Cancer Types in Louisiana	Non-Modifiable Risk Factors	Modifiable Risk Factors
	when breasts are still developing), benign breast disease, or high breast density Exposure to diethylstilbestrol (DES)	Menopausal hormone therapy (combined estrogen and progestin)
Colon & Rectum	- Age - Race/ethnicity - Personal or family history of colon or rectal cancer and/or polyps - Personal history of chronic inflammatory bowel disease, ulcerative colitis, Crohn's disease, or ovarian cancer - Inherited genetic conditions (ex. Lynch syndrome, familial adenomatous polyposis, or hereditary nonpolyposis colon cancer) - Type II diabetes	- Obesity - Physical inactivity - Long-term smoking - Moderate - heavy alcohol consumption - High consumption of red or processed meat - Low intake of calcium, fruits, vegetables and whole-grain fiber - Long-term use of nonsteroidal anti-inflammatory drugs can reduce risk
Kidney & Renal Pelvis	- Family history of kidney cancer - Chronic renal failure - Race (African Americans) - Sex (Men) - Advanced kidney disease (those needing dialysis) - Genetic and hereditary risk factors: Von-Hippel Lindau syndrome, Hereditary papillary renal cell carcinoma, Hereditary leiomyoma-renal cell carcinoma, Birt-Hogg-Dube (BHD) syndrome, Familial renal cancer, Cowden syndrome, Tuberous sclerosis	- Obesity - Smoking - High blood pressure - Occupational exposure to chemicals like trichloroethylene (organic solvent) or cadmium, or herbicides - Certain medicines: Phenacetin & Diuretics
Non-Hodgkin Lymphoma	- Increased age - Sex - Race-ethnicity - Family history of lymphoma in first degree relative - Weakened immune system due to HIV infection, inherited immunodeficiency syndromes, or receiving immune suppressants to prevent organ transplant rejection - Personal history of Sjogren syndrome, lupus, or rheumatoid arthritis	- Infection with Epstein Barr virus, Human Immunodeficiency Virus (HIV), Human T-cell lymphotropic virus (HTLV-1), <i>Helicobacter pylori</i>, or Hepatitis C virus - Chemical exposures to benzene and certain herbicides and insecticides - Excessive body weight or diet high in fat and meats - Radiation exposure - Breast implants (breast implant-associated anaplastic large cell lymphoma (BIA-ALCL))
Urinary Bladder	- Bladder birth defects or long-term urinary catheters - Personal or family history of bladder cancer	Tobacco use

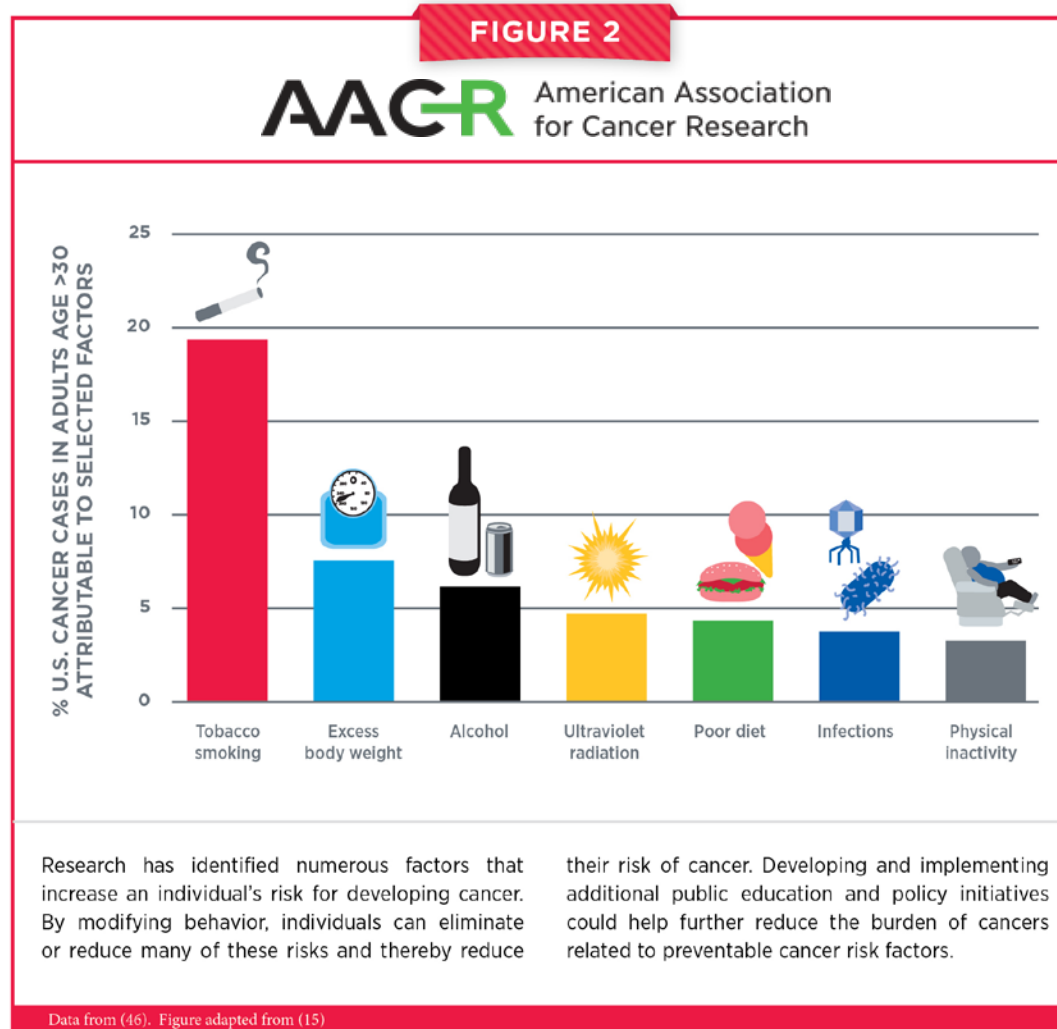

Top Cancer Types in Louisiana	Non-Modifiable Risk Factors	Modifiable Risk Factors
	• Race-ethnicity • Age • Sex (men>women) • Inherited genes (GST and NAT) • Inherited genetic syndromes (retinoblastoma, Cowden Disease, Lynch Syndrome) • Chronic bladder irritation and infections • Chemotherapy or radiation therapy	• Cancer treatment with cyclophosphamide or having radiation therapy to abdomen or pelvis • Working in the dye, rubber, chemical, metal, textile, leather or aluminum industries • Working as a hairdresser, machinist, printer, painter, or truck driver • Living in a community with high levels of arsenic in the drinking water • Diabetes medicine, pioglitazone (Actos), linked to increase risk of bladder cancer with higher dosage • Dietary supplement containing aristolochic acid • Lack of fluid intake (water)
Melanoma of the Skin	• Age • Sex • Race • Presence of atypical, large, or more than 50 moles • Sun-sensitivity (fair-skinned, burning easily, or having natural blonde or red hair, blue or green eyes) • Personal or family history of melanoma or skin cancer • Weakened immune system due to HIV infection, certain cancers or taking immune suppressants to prevent organ transplant rejection • Inherited condition, Xeroderma pigmentosum (rare, affect skin cells' ability to repair damage to their DNA)	• Heavy exposure to ultraviolet radiation from sunlight or indoor tanning beds • Personal history of having at least one severe, blistering sunburn in youth
Pancreas	• Age (older than 45 years) • Sex (men>women) • Race (African Americans more likely than whites) • Personal history of chronic pancreatitis or diabetes • Personal history of certain genetic syndromes ◦ Inherited Lynch Syndrome (defective MLH1 OR MSH2 genes) and Peutz-Jeghers Syndrome (STK11 gene defect) • BRCA1 and BRCA2 and PALB2 gene mutation carrier • Family history of pancreatic cancer • Type II Diabetes	• Tobacco use • Obesity • Heavy alcohol consumption • Heavy occupation exposure to chemicals used in dry cleaning and metal working industries

Top Cancer Types in Louisiana	Non-Modifiable Risk Factors	Modifiable Risk Factors
	Chronic pancreatitis	
Leukemia	- Age - Sex (men>women) <i>The following risk factors are specific to the subtype:</i> - o <u>Acute lymphocytic leukemia (ALL)</u>: race/ethnicity, inherited genetic syndromes, viral infections (Human T-cell lymphoma/leukemia virus-1, Epstein-Barr virus), having an identical twin with ALL - o <u>Acute myeloid leukemia (AML)</u>: blood disorders, inherited genetic disorders, family history of AML, treatment with certain chemotherapy drugs - o <u>Chronic lymphocytic leukemia (CLL)</u>: family history of CLL, race/ethnicity, exposure to agent orange	- Exposure to ionizing radiation - Occupational exposure to benzene or ethylene oxide (oil refining or rubber manufacturing occupations) - Exposure to chemotherapy treatment - Obesity - Radiation therapy or exposure <i>The following risk factors are specific to the subtype:</i> - o <u>Acute lymphocytic leukemia (ALL)</u>: parental smoking before or after birth, radiation exposure, certain chemical exposures (benzene) - o <u>Acute myeloid leukemia (AML)</u>: tobacco use, parental smoking before or after birth, exposure to certain chemicals, such as formaldehyde and benzene - o <u>Chronic lymphocytic leukemia (CLL)</u>: radon exposure at home
Oral Cavity & Pharynx	- Age (>55) - Sex (men > women) - Personal history of oral cavity and pharynx cancer - Weaken immune system caused by Acquired Immunodeficiency Syndrome (AIDS) or medicines for organ transplants - Inherited genetic syndromes: Fanconi anemia or Dyskeratosis congenita - o Lichen planus	- Tobacco use - Excessive alcohol use - Sun exposure - HPV infection of mouth and throat - Betel nut use (chewing) - Poor nutrition/diet low in fruits and vegetables - o Graft-vs-host disease (GVHD): stem cell transplant using grafts
Thyroid	- Sex (women>men) - Age - Family history of thyroid cancer from first-degree relatives - Certain genetic conditions, such as <i>RET</i> gene mutation or familial adenomatous polyposis (FAP) - Hereditary diseases such as Cowden Disease, Carney complex Type I	- Obesity - Exposure to ionizing radiation early in life - Diet low in iodine

Top Cancer Types in Louisiana	Non-Modifiable Risk Factors	Modifiable Risk Factors
Corpus Uterus	• Age • Race • Long menstrual history • Family history of uterine or colorectal cancer • Personal history of Lynch syndrome • Endometrial hyperplasia • Type II Diabetes • Inherited conditions: Polycystic ovary syndrome and Cowden syndrome	• Obesity and abdominal fatness • Insufficient physical activity • Increased estrogen exposure through: ○ use of postmenopausal estrogen ○ late menopause ○ never having children ○ history of polycystic ovary syndrome • Use of Tamoxifen to prevent or treat breast cancer • Metabolic syndrome • Never being pregnant
Liver & Intrahepatic Bile Duct	• Sex (men>women) • Race/ethnicity (highest rates among Asian Americans and Pacific Islanders) • Non-alcoholic steatohepatitis (NASH) • Genetic conditions: Hereditary Hemochromatosis (HH), Tyrosinemia, Alpha1-antitrypsin deficiency, Porphyria cutanea tarda, Glycogen storage disease, Wilson disease • Type II Diabetes • Cirrhosis	• Tobacco use • Heavy alcohol consumption • Obesity • Chronic Hepatitis B virus or Hepatitis C virus infections • Exposure to aflatoxin B1, vinyl chloride, or thorium dioxide • Anabolic steroids • Arsenic in drinking water • Parasitic infection
